

The 30 inch gas pipeline under consideration should not be approved as it will be rendered unnecessary once people come to their senses and criminalize Hydraulic fracturing of shale deposits. The pipeline itself would pose a hazard to communities by the simple fact that so much explosive material gathered in one place over a long expected life cycle is sure to have a statistical percentage of failure. This large transmission line will enable the construction of countless feeder lines. The construction of such invasive infa-structure damages the entire ecosystem in both obvious and subtle ways. The entire natural gas infa-structure is inappropriate, destructive of important natural resources and unnecessary. Do not approve this pipeline.
